STAC51 Assignment 1

Joseph Wang

2023-01-28

Question 1

a)

The PMF of a Multinomial (n, π_1, \dots, π_k) is

$$f_{\mathbf{Y}}(\mathbf{y}) = \frac{n!}{y_1! \dots y_k!} \pi_1^{y_1} \dots \pi_k^{y_k}$$

Thus is the multivariate moment generating function is

$$M_{\mathbf{Y}}(\mathbf{t}) = E(e^{\mathbf{t}'\mathbf{y}})$$

$$= \Sigma_{y_1}^n \Sigma_{y_2}^{n-y_1} \dots \Sigma_{y_k}^{n-y_1 \dots - y_{k-1}} e^{t_1 y_1 + \dots + t_k y_k} \frac{n!}{y_1! \dots y_k!} \pi_1^{y_1} \dots \pi_k^{y_k}$$

$$= \Sigma_{y_1}^n \Sigma_{y_2}^{n-y_1} \dots \Sigma_{y_k}^{n-y_1 \dots - y_{k-1}} \frac{n!}{y_1! \dots y_k!} (e^{t_1} \pi_1)^{y_1} \dots (e^{t_k} \pi_k)^{y_k}$$

$$= (\Sigma_k^i e^{t_i} \pi_i)^n$$

By the Multinomial Theorem.

b)

The moment generating function for the ith var is

$$M_{Y_i}(t) = M_{\bar{Y}}(0, \dots, t, \dots, 0)$$

= $(\pi_1 + \dots + e^t \pi_i + \dots + \pi_k)^n$

Where t is in the ith position.

The mean is

$$E(Y_i) = \frac{\partial}{\partial t} M_{Y_i}(0)$$

$$= n(\pi_1 + \dots + e^t \pi_i + \dots + \pi_k)^{n-1} e^t \pi_i|_{t=0}$$

$$= n\pi_i$$

Since $(\pi_1 + \cdots + \pi_k) = 1$.

c)

The second moment is

$$E(Y_i^2) = \frac{\partial^2}{\partial t^2} M_{Y_i}(0)$$

$$= \frac{\partial}{\partial t} n(\pi_1 + \dots + e^t \pi_i + \dots + \pi_k)^{n-1} e^t \pi_i|_{t=0}$$

$$= n(\pi_1 + \dots + e^t \pi_i + \dots + \pi_k)^{n-1} e^t \pi_i + e^t \pi_i * n(n-1)(\pi_1 + \dots + e^t \pi_i + \dots + \pi_k)^{n-2} e^t \pi_i|_{t=0}$$

$$= n\pi_i + n^2 \pi_i^2 - n\pi_i^2$$

Since $(\pi_1 + \cdots + \pi_k) = 1$.

The variance is

$$Var(Y_i) = E(Y_i^2) - E(Y_i)^2$$

= $n\pi_i + n^2\pi_i^2 - n\pi_i^2 - n^2\pi_i^2$
= $n\pi_i(1 - \pi_i)$

Since $E(Y_i)^2 = (n\pi_i)^2$

d)

The joint moment generating function for the ith and jth var is

$$M_{Y_iY_j}(t_i, t_j) = M_{\bar{Y}}(0, \dots, t_i, \dots, t_j, \dots, 0)$$

= $(\pi_1 + \dots + e^{t_i}\pi_i + \dots + e^{t_j}\pi_j + \dots + \pi_k)^n$

The expected value of Y_iY_j is

$$E(Y_{i}Y_{j}) = \frac{\partial^{2}}{\partial t_{i}t_{j}} M_{Y_{i}Y_{j}}(0,0)$$

$$= \frac{\partial}{\partial t_{j}} n(\pi_{1} + \dots + e^{t_{i}}\pi_{i} + \dots + e^{t_{j}}\pi_{j} + \dots + \pi_{k})^{n-1} e^{t_{i}}\pi_{i}|_{t_{i},t_{j}=0}$$

$$= n(n-1)(\pi_{1} + \dots + e^{t_{i}}\pi_{i} + \dots + e^{t_{j}}\pi_{j} + \dots + \pi_{k})^{n-2} e^{t_{i}}\pi_{i}e^{t_{j}}\pi_{j}|_{t_{i},t_{j}=0}$$

$$= n(n-1)\pi_{i}\pi_{j}$$

Since $(\pi_1 + \cdots + \pi_k) = 1$.

The covariance of Y_iY_j is

$$Cov(Y_i, Y_j) = E(Y_i Y_j) - E(Y_i) E(Y_j)$$

$$= n(n-1)\pi_i \pi_j - n^2 \pi_i \pi_j$$

$$= -n\pi_i \pi_j$$

Since $E(Y_i)E(Y_i) = (n\pi_i)(n\pi_i)$

e)

Given c = 2, $1 - \pi_i - \pi_j = 0$

$$Cor(Y_i, Y_j) = \frac{Cov(Y_i, Y_j)}{\sqrt{Var(Y_i)Var(Y_j)}}$$

$$= \frac{-n\pi_i\pi_j}{\sqrt{n\pi_i(1 - \pi_i)n\pi_j(1 - \pi_j)}}$$

$$= \frac{-\pi_i\pi_j}{\sqrt{\pi_i\pi_j(1 - \pi_i - \pi_j + \pi_i\pi_j)}}$$

$$= -1$$

This makes sense given n and c=2 as if the number of successes one category increases, the number of successes in the other category has to decrease. The change is 1:1 and thus has a linear relationship of factor 1.

Question 2

```
y = 5
n = 30
pihat = y/n
alpha = 0.1
```

a)

Test P-values

```
pi0 = 0.1
yfit = pi0*n

sewald= sqrt(pihat*(1-pihat)/n)
sescore = sqrt(pi0*(1-pi0)/n)

wald = (pihat - pi0)/sewald
score = (pihat - pi0)/sescore
lrt = 2*(y*log(y/yfit) + (n-y)*log((n-y)/(n-yfit)))
wald
```

[1] 0.9797959

score

[1] 1.217161

```
lrt
## [1] 1.260204
2*pnorm(wald, lower.tail = FALSE)
## [1] 0.3271869
2*pnorm(score, lower.tail = FALSE)
## [1] 0.2235429
pchisq(lrt,1,lower.tail = FALSE)
## [1] 0.2616124
The test statistics for Wald, Score and LRT are 0.9797959, 1.217161 and 1.260204. The P-Values for Wald,
Score and LRT are 0.3271869, 0.2235429 and 0.2616124.
b)
Wald CI
z = qnorm(1-alpha/2)
c(pihat - z*sewald, pihat + z*sewald)
## [1] 0.05474855 0.27858478
The Wald CI is (0.05474855, 0.27858478).
c)
Score CI
 c(((n*pihat+z^2/2)-z*sqrt(n*pihat*(1-pihat)+z^2/4))/(n+z^2),((n*pihat+z^2/2)+z*sqrt(n*pihat*(1-pihat)+z^2/4))/(n+z^2),((n*pihat+z^2/2)+z*sqrt(n*pihat*(1-pihat)+z^2/4))/(n+z^2),((n*pihat+z^2/2)+z*sqrt(n*pihat*(1-pihat)+z^2/4))/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(n+z^2)/(

Same as the calculated CIs.

Question 3

The likelihood function is $l(\theta|y) = \binom{n}{y}(\theta)^y(1-\theta)^{n-y}$. With n = 30 and y = 5.

a)

Thus the likelihood under $\pi_0 = 0.1$ is

$$l(0.1|5) = {30 \choose 5} (0.1)^5 (0.9)^{25}$$

```
10 = choose(n,y)*(pi0)^5*(1-pi0)^(n-y)
```

[1] 0.1023048

The maximum likelihood under H_0 is 0.1023048.

b)

The MLE is the maximized likelihood over all possible values. $\hat{\pi} = \frac{y}{n} = \frac{5}{30} = \frac{1}{6}$.

$$l(\frac{1}{6}|5) = {30 \choose 5} (\frac{1}{6})^5 (\frac{5}{6})^{25}$$

```
11 = choose(n,y)*(pihat)^5*(1-pihat)^(n-y)
11
```

[1] 0.1921081

The maximum likelihood under the MLE is 0.1921081.

c)

```
1rt2 = -2*log(10/11)
1rt2
```

[1] 1.260204

The LRT statistic is 1.260204.

d)

```
qchisq(0.9, df=1)
```

[1] 2.705543

The test statistic must be at least greater than the critical value at 2.705543.

e)

```
library(rootSolve)

f1 = function(pif){
   -2*(y*log(pif) + (n-y)*log(1-pif)-y*log(pihat) - (n-y)*log(1-pihat)) - qchisq(0.9, df=1)
}
uniroot.all(f=f1,interval=c(0,1))
```

[1] 0.0756936 0.2963735

The LRT CI is (0.0756936, 0.2963735).

Question 4

```
a)
N = 100000
n = 25
pi = 0.06
alpha = 0.05
za = qnorm(1-alpha/2)
count = 0
for(i in 1:N){
  z = rbinom(n, 1, pi)
 y = sum(z)
 pi_hat = y/n
 l = pi_hat - za*sqrt(pi_hat*(1-pi_hat)/n)
  t = pi_hat + za*sqrt(pi_hat*(1-pi_hat)/n)
  if(1<= pi & pi <= t){</pre>
    count = count + 1
}
count/N
```

[1] 0.78547

As explained in lecture, unless n is very large, the Wald CI's true coverage is lower than $(1 - \alpha)\%$ when π approaches 0 or 1.

b)

```
p = 0
n = 25
for(i in 0:n){
    pi_hat = i/n

l = pi_hat - za*sqrt(pi_hat*(1-pi_hat)/n)
    t = pi_hat + za*sqrt(pi_hat*(1-pi_hat)/n)
    if(l<= pi & pi <= t){
        p = p + choose(n,i)*(pi)^i*(1-pi)^(n-i)
    }
}</pre>
```

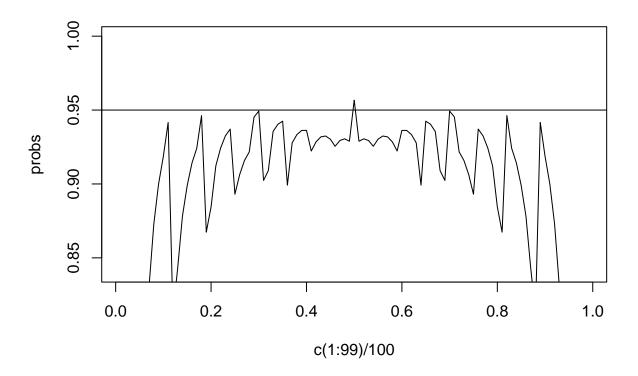

[1] 0.784026

The true confidence is 0.784026 and is close to the simulated value

Question 5

a)

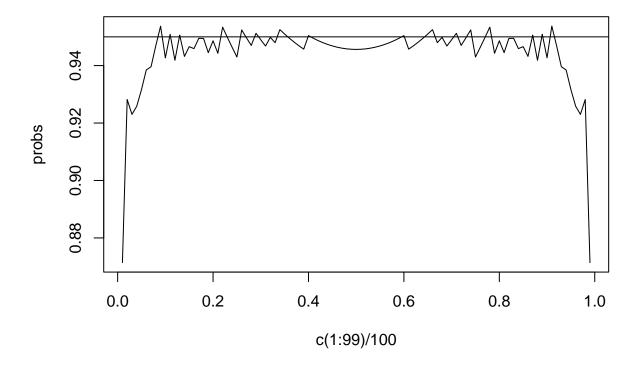

```
probs = c()
n=25
alpha = 0.05
z = qnorm(1-alpha/2)
for(i in 1:99){
 pi = i/100
  p = 0
  for(j in 0:n){
    pi_hat = j/n
    l = pi_hat - z*sqrt(pi_hat*(1-pi_hat)/n)
    t = pi_hat + z*sqrt(pi_hat*(1-pi_hat)/n)
    if(1<= pi & pi <= t){</pre>
      p = p + choose(n,j)*(pi)^j*(1-pi)^(n-j)
    }
  probs = append(probs, p)
plot(x=c(1:99)/100, y=probs, type="l", ylim=c(0.84,1))
abline (h=0.95)
```

Given a small n, the function does not consistently hit the 95% inclusion mark and that probability decreases as π approaches 0 or 1. This is consistent with what we found in question 4a).

b)

```
probs = c()
n=500
for(i in 1:99){
 pi = i/100
  p = 0
  for(j in 0:n){
    pi_hat = j/n
    1 = pi_hat - z*sqrt(pi_hat*(1-pi_hat)/n)
    t = pi_hat + z*sqrt(pi_hat*(1-pi_hat)/n)
    if(1<= pi & pi <= t){</pre>
      p = p + choose(n,j)*(pi)^j*(1-pi)^(n-j)
    }
  }
  probs = append(probs, p)
plot(x=c(1:99)/100, y=probs, type="l")
abline(h=0.95)
```

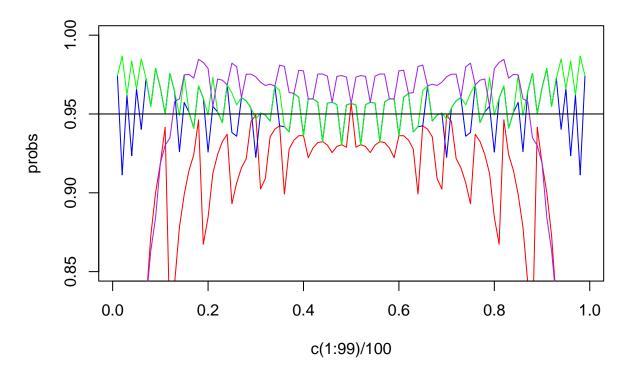

Just like a) the probability decreases as π approaches 0 or 1 but since we have a relatively larger n = 500, the CI hits the true coverage probability more often.

c)

```
probs = c()
n=25
for(i in 1:99){
  pi = i/100
  p = 0
  for(j in 0:n){
    pi_hat = j/n
    1 = pi_hat - z*sqrt(pi_hat*(1-pi_hat)/n)
    t = pi_hat + z*sqrt(pi_hat*(1-pi_hat)/n)
    if(1<= pi & pi <= t){</pre>
      p = p + choose(n,j)*(pi)^j*(1-pi)^(n-j)
    }
  }
  probs = append(probs, p)
plot(x=c(1:99)/100, y=probs, type="l", ylim=c(0.85,1), col="red")
abline(h=0.95)
```

```
probs = c()
for(i in 1:99){
 pi = i/100
 p = 0
 for(j in 0:n){
    pi_hat = j/n
    1 = ((n*pi_hat+z^2/2)-z*sqrt(n*pi_hat*(1-pi_hat)+z^2/4))/(n+z^2)
    t = ((n*pi_hat+z^2/2)+z*sqrt(n*pi_hat*(1-pi_hat)+z^2/4))/(n+z^2)
    if(1<= pi & pi <= t){</pre>
     p = p + choose(n,j)*(pi)^j*(1-pi)^(n-j)
    }
 }
 probs = append(probs, p)
lines(x=c(1:99)/100, y=probs, type="l",col="blue")
abline(h=0.95)
probs = c()
ns = n+z^2
for(i in 1:99){
 pi = i/100
 p = 0
 for(j in 0:n){
    pis = (j+z^2/2)/(n+z^2)
    1 = pis-z*sqrt(pis*(1-pis)/ns)
    t = pis+z*sqrt(pis*(1-pis)/ns)
    if(l<= pi & pi <= t){</pre>
      p = p + choose(n,j)*(pi)^j*(1-pi)^(n-j)
    }
 }
 probs = append(probs, p)
lines(x=c(1:99)/100, y=probs, type="l",col="green")
abline(h=0.95)
probs = c()
for(i in 1:99){
 pi = i/100
 p = 0
 for(j in 1:(n-1)){
   1 = 1/(1 + (n-j+1)/(j*qf(alpha/2,2*j,2*(n-j+1))))
    t = 1/(1 + (n-j)/((j+1)*qf(1-alpha/2,2*(j+1),2*(n-j))))
    if(1<= pi & pi <= t){</pre>
      p = p + choose(n,j)*(pi)^j*(1-pi)^(n-j)
 }
 probs = append(probs, p)
lines(x=c(1:99)/100, y=probs, type="1",col="purple")
abline(h=0.95)
```

The order of inclusion rates seems to be Clopper-Preason, Agresti-Coull, Score and Wald. The higher inclusion rates could be because of wider CIs.

Question 6

a)

View each square as an independent Poisson distribution. Thus their joint distribution is,

$$P(X_1 = x_1, \dots, X_{576} = x_{576} | \lambda) = P(X_1 = x_1 | \lambda) \dots P(X_{576} = x_{576} | \lambda)$$

$$= (\frac{e^{-\lambda} \lambda^0}{0!})^{229} * (\frac{e^{-\lambda} \lambda^1}{1!})^{221}$$

$$* (\frac{e^{-\lambda} \lambda^2}{2!})^{93} * (\frac{e^{-\lambda} \lambda^3}{3!})^{35}$$

$$* (\frac{e^{-\lambda} \lambda^4}{4!})^7 * (\frac{e^{-\lambda} \lambda^5}{5!})^1$$

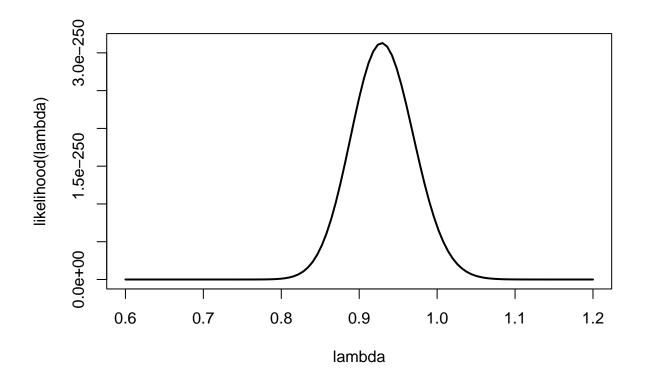

$$= e^{-576\lambda} \lambda^{535} / C$$

The likelihood function is

$$l(\theta|x) = e^{-576\lambda} \lambda^{535}$$

b)

```
n=576
total = sum(c(1,2,3,4,5)*c(211,93,35,7,1))
likelihood = function(lambda){
   exp(-n*lambda)*lambda^total
}
curve(likelihood, from=0.6, to=1.2, xlab="lambda", ylab="likelihood(lambda)", lwd=2)
```

 $\mathbf{c})$

```
max = optimize(likelihood, interval=c(0.6,1.2), maximum=TRUE)$maximum
max
## [1] 0.9288118
```

The MLE for lambda is 0.9288118. ## d)

```
test = -2*log(likelihood(1)/likelihood(max))
test
```

```
## [1] 2.990222
```

```
qchisq(0.95, df=1)
```

[1] 3.841459

Cannot reject $H_0: \lambda = 1$ since test statistic < critical value.
